General information

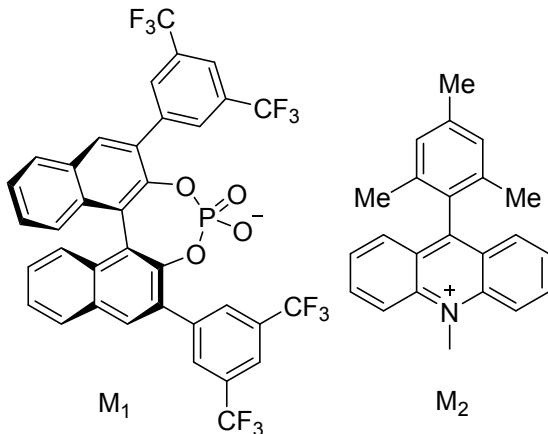

The commercial materials were purchased from Shanghai Energy or Tianjin Heowns. Solvents were treated by the standard methods. Reactions were powered by magnetic stirrers. Flash column chromatography was carried out on silica gel (300–400 mesh) using a forced flow of eluent. For TLC, silica gel plates were used and visualized by fluorescence quenching under UV light. All the NMR spectra were recorded on Bruker NMR spectrometers. Chemical shifts (δ) for ^1H NMR (400 Hz), ^{13}C NMR (100 Hz) were given in ppm. Data were reported as follows: chemical shift, integration, multiplicity (s = single, d = doublet, t = triplet, q = quartet, br = broad, m = multiplet) and coupling constants (Hz). High resolution mass spectra (HRMS) were recorded on a Bruker DaltonicsmaXisUHR-TOF MS. Melting points were determined on a SGW X-4 microscope melting point apparatus and were uncorrected. X-ray crystallography analysis was performed on a Bruker X8 APEX X-ray diffraction meter. The blue light source (465nm) was provided by WATTECS WP-TEC-1020 parallel reactor.

The Chiral Photoredox Catalyst

A solution of 9-mesityl-10-methylacridinium perchlorate (0.5 mmol) in methanol passed ion-exchange resin (amberlyst A-26, OH- form) for a long time, and the resin was washed by methanol three times. The resulting solution was treated with chiral phosphoric acid (0.5 mmol) at room temperature. The obtained phase was stirred for 5 minutes, and then was removed at reduced pressure to yield the chiral photosensitizer 9.

The preparation of the substrates 1.

The substrates **1** used in this paper are synthesized according to the previous literatures.¹⁻³

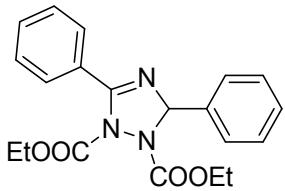

The preparation of the compounds 3.

The substrates **1** (0.5 mmol) was added into a DCE (2 mL) solution, then

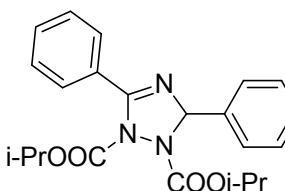

azodicarboxylates **2** (0.75 mmol) and catalyst **I** (5 mol%, 0.025 mmol) was added into the mixture. The mixture was stirred at room temperature under blue LED until finished (determined by TLC analysis). The crude product was purified by flash chromatography on silica gel (eluent: PE/EtOAc from 10:1 to 5:1) affording to corresponding **3**.

The preparation of the aromatization compounds 6.

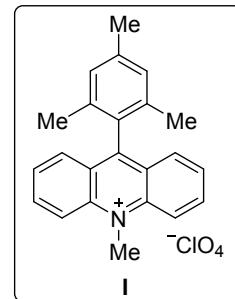

The substrates **3** (0.05 mmol) was added into a DCE (0.5 mL) solution, then catalyst **I** (5 mol%, 0.0025 mmol) was added into the mixture. The mixture was

stirred at room temperature under blue LED until finished (determined by TLC analysis). The crude product was purified by flash chromatography on silica gel (eluent: PE/EtOAc from 10:1 to 5:1) affording to the aromatization compounds **6**.

The preparation of the compound 7 and 8.

The $LiAlH_4$ (2 mmol) was added into a dry THF solution (5 mL). The system was stirred at ice bath for 10 mim, then dry THF (1 mL) solution dissolving **6a** (0.5 mmol) was added into the mixture. The solution was stirred for another 15 min at ice bath, then refluxed overnight. After the system had cooled to room temperature, deionized water was added. After stirred at ice bath for 30mim, the residue was diluted by DCM and washed with water and brine sequentially, dried over Na_2SO_4 , filtered, and concentrated. The crude product was purified by flash chromatography on silica gel (eluent: PE/EtOAc from 5:1 to 2:1) to afford the product **7**.

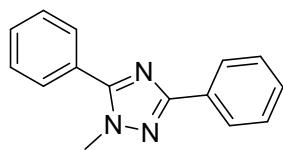

The product **7** (0.2 mmol), Cs_2CO_3 (0.3 mmol), KI (0.04 mmol) were dissolved in 5 mL CH_3CN , and then the MeI (0.22 mmol) was added to the mixture. The system was stirred at room temperature for 2 h. After finished (determined by TLC), the mixture was concentrated and washed by water and brine, dried over Na_2SO_4 , filtered, and concentrated to obtain the product **8**.
